    // Necessary for Fire OAuth to Function
    const fireBroadcastingChannel = new BroadcastChannel('fireOAuthChannel');
    fireBroadcastingChannel.addEventListener('message', async event => {
      let data = event.data
      * @typedef {Object<string, any>} Data
      * @property {boolean} success - Whether the login was successful
      * @property {string} token - The data returned from the login i.e. Fire Token
      // data.token is the message sent from the fireOAuthChannel after verification
      // data.success is a boolean that indicates whether the verification was successful
      // data.token is the fire token
      // What to do with the Fire Token?
      //* Fire Token is an unique token which uniquely identifies the user who authorized your login attempt
with Fire
      //* You can use this token ONLY ONCE as it will be destroyed after the first use
      // 1. Send the fire token to the Fire Server to verify the user
      // - You can do that client sided or server sided
      // - You need to send a POST Request to the Fire Server with the fire token
      // at the URL: http://localhost:3003/api/tokens/verify
      // - The Fire Server will verify the fire token and return a response
          - If the verification was successful - CODE (200), the Fire Server will return a response with the
user's data
      // - If the verification was unsuccessful - CODE (400) or CODE (401), the Fire Server will return a
response with an error 'message'
      // - You can use the data returned from the Fire Server to create a new user in your database
      // This example will send the token to Fire Servers and console.log the response
       console.log("%c" + `Fire Token: ${data.token}`, `color: #f1c40f; font-weight: bold;`);
```

```

// What to do with the Fire Token?
      //* Fire Token is an unique token which uniquely identifies the user who authorized your login attempt
with Fire
       //* You can use this token ONLY ONCE as it will be destroyed after the first use
      // 1. Send the fire token to the Fire Server to verify the user
      // - You can do that client sided or server sided
      // - You need to send a POST Request to the Fire Server with the fire token
      // at the URL: http://localhost:3003/api/tokens/verify
      // - The Fire Server will verify the fire token and return a response
      // - If the verification was successful - CODE (200), the Fire Server will return a response with the
user's data
      // - If the verification was unsuccessful - CODE (400) or CODE (401), the Fire Server will return a
response with an error 'message'
      // - You can use the data returned from the Fire Server to create a new user in your database
      // This example will send the token to Fire Servers and console.log the response
       console.log("%c" + `Fire Token: ${data.token}`, `color: #f1c40f; font-weight: bold;`);
